

Why should we care about quantum computing?

What is our business exposure?

What happens if we do nothing?

What is our mitigation strategy?

What decisions do we need today?

- **Protect our information.**

We must protect sensitive business information throughout its required confidentiality lifespan.

- **Modernize our technology.**

We must transition vulnerable cryptographic systems to standardized quantum-resistant alternatives.

- **Prepare before the threat materializes.**

We must start early to reduce migration costs, operational disruption and future business exposure.
